

OpenMed develops, markets and supports platform-independent, Internet-enabled clinical information and medical image management software solutions. These systems capture, display, manipulate, combine and distribute images, sounds, text and scanned documents to supplement an institution's healthcare information system or to function as a stand-alone distributed electronic medical record system.

Using OpenMed, healthcare professionals eliminate the use of film-based imaging, reduce cost, increase speed and reduce errors during the creation, maintenance, archival storage, distribution and retrieval of multimedia clinical patient records among hospitals, referring physician, imaging centers and clinical laboratories.

For smaller healthcare institutions, OpenMed offers **CIMS Complete™**, a comprehensive program to cost-effectively deploy, support and maintain a full-fledged Clinical Image Management System. **CIMS Complete™** combines OpenMed technology with a flexible pricing structure, financing options, non-disruptive deployment methods, remote technical support services and long-term IT corporate planning in order to reduce financial and technological barriers that could prevent these institutions from reaping the benefits of an all-digital, film-less environment.
